2.3 Statement of compliance

The EMF values found for the F5521gw (KRD 131 18/2) PCIe Wireless mini card are below the maximum allowed levels according to the standards listed in section 3, when used with an antenna with maximum gain as listed in chapter 4.4.

Note : Compared to F5521gw (KRD 131 18/1) the version of this PCIe Wireless mini card documented in this report (KRD 131 18/2) is limited to GPRS class 10 but can transmit with MSPR disabled (no power reduction with 2 timeslots).

3.1 Purpose of this report

The purpose of this report is to show the compliance of certain simultaneous transmission configurations for use in mobile exposure conditions.

In addition to basic requirements of the standards listed above (including FCC Part 22 H and Part 24 E) the following requirements have been taken into account:

- The module must be categorically excluded by FCC 47 CFR § 2.1091 (c) and the antenna separation distance and MPE compliance boundary requirements that enable all simultaneous transmitting antennas incorporated within the host shall comply with MPE limits as specified in FCC 47 CFR § 1.1310.
  (see chapter 8 of FCC KDB 447498 D01 Mobile Portable RF Exposure)

If these requirements are kept the module can be incorporated in mobile host devices without further testing or certification.

4 Evaluating compliance with requirements for human exposure to EMFs

4.1 Maximum permissible exposure (MPE)

Fixed/mobile exposure conditions of multiple transmitters installed in different hosts represent the most difficult situation in terms of the determination of minimum safety distances.
While EMF measurements most often only refer to a single configuration with only one transmitter or with multiple co-located transmitters a general approach is needed to determine a worst case condition under which several transmitters and their antennas can be installed to prevent additional RF exposure evaluation for each host.
This test report illustrates different scenarios how radio modules can be integrated in notebook hosts without the need of further testing.
The target is to determine a maximum EIRP or antenna gain for a WWAN module using GSM and/or UMTS frequencies, which is used stand-alone or collocated with other antennas for WLAN, Bluetooth, WiMAX etc.

The background of the calculation is a minimum distance of 20 cm between antenna(s) and user (mobile exposure condition), and the compliance with the requirements of chapter 3.1.

4.2 Limits and normative references

There is a number of international and national regulations, standards and guidelines for exposure to electromagnetic fields. For the evaluations in this report the following reference levels have been applied.

4.2.1 FCC and IC requirements

Frequency range	E-field strength (V/m)	H-field strength (A/m)	B-field strength (µT)	Power density (mW/cm²)
300 – 1500 MHz	--	--	--	f(MHz) / 1500
1.5 – 100 GHz	--	--	--	1.0

Categorically exclusion per § 2.1091 (c) : - below 1.5 GHz : avg. ERP < 1.5 W (= 33.9 dBm EIRP)
- above 1.5 GHz : avg. ERP < 3 W (= 36.9 dBm EIRP)

Part 22 H ERP limit : max. 7 W (38.45 dBm) burst power (= 40.6 dBm EIRP)
Part 24 E EIRP limit : max. 2 W (33.0 dBm) burst power

4.2.2 EN requirements

Frequency range	E-field strength (V/m)	H-field strength (A/m)	B-field strength (µT)	Power density (mW/cm²)
400 – 2000 MHz	$1.375*f(MHz)^{1/2}$	$0.0037*f(MHz)^{1/2}$	$0.0046*f(MHz)^{1/2}$	f(MHz) / 2000
2 – 300 GHz	61	0.16	0.2	1.0

4.2.3 Australian requirements

Frequency range	E-field strength (V/m)	H-field strength (A/m)	B-field strength (µT)	Power density (mW/cm²)
400 – 2000 MHz	$1.375*f(MHz)^{1/2}$	$0.0037*f(MHz)^{1/2}$	$0.0046*f(MHz)^{1/2}$	f(MHz) / 2000
2 – 300 GHz	61	0.16	0.2	1.0

Reference levels are provided for exposure assessment to determine whether the basic restrictions on exposure of humans to electromagnetic fields are exceeded. The basic restrictions on exposure to electromagnetic fields are based directly on established health effects and biological considerations.

4.3 Conducted power analysis

For the measurements a Rohde & Schwarz Radio Communication Tester CMU 200 was used.
The output power was measured using an integrated RF connector and attached RF cable.

Note: CMU200 measures GSM peak and average output power for active timeslots.
For MPE calculations the timebased average power is relevant. The difference inbetween depends on the duty cycle of the TDMA signal :

No. of timeslots	***1***	***2***	***3***	***4***
Duty Cycle	1 : 8	1: 4	1 : 2.66	1 : 2
timebased avg. power compared to slotted avg. power	- 9 dB	- 6 dB	- 4.25 dB	- 3 dB

The signalling modes differ as follows :

mode	***coding scheme***	***modulation***
GPRS	CS1 to CS4	GMSK
EGPRS (EDGE)	MCS1 to MCS4	GMSK
EGPRS (EDGE)	MCS5 to MCS9	8PSK

Apart from modulation change (GMSK/8PSK) coding schemes differ in code rate without influence on the RF signal. Therefore one coding scheme per mode was selected for conducted power measurements. The frequency with the highest output power per band was used for this analysis.

Maximum antenna gain < 1 GHz **(collocated scenarios)**	**3.55 dBi**	limitation by ICNIRP RF exposure limit **(collocation with WLAN and/or WiMAX)**
Maximum antenna gain > 1.7 GHz **(stand-alone and collocated scenarios)**	**2.50 dBi**	limitation by FCC Part 24 E EIRP limit)*

)* FCC limits for maximum E(I)RP are overlaying maximum exposure limits.

The table below lists the calculated maximum EIRP values which represent the worst case condition of all standards and limits listed in chapter 4.2.
Unless peak burst power is required for evaluation the GSM timeslot configuration with highest time based average power has been used for calculation.

a) Maximum antenna gain determination in stand-alone situation. For details see annex A.1.

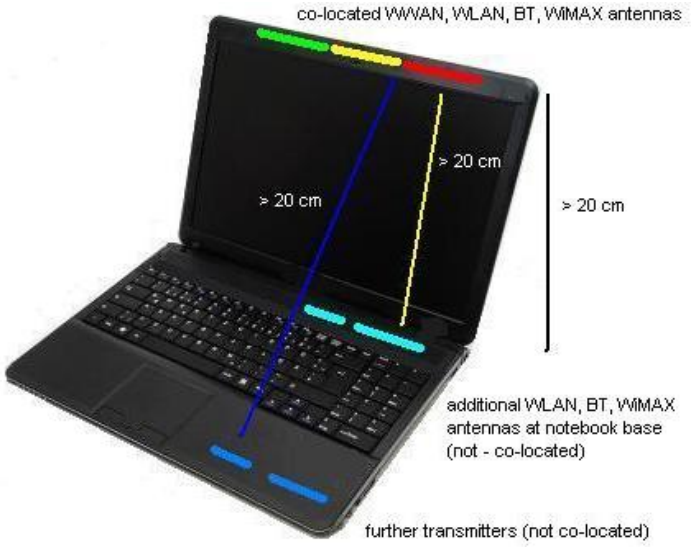
Additional illustration:

- Table a) shows the maximum antenna gain for the WWAN module so that the worst case power density limits are met in stand-alone configuration.
- Table b) shows the maximum antenna gain for the WWAN module so that the worst case power density limits are met in all collocated scenarios.
- Table c) shows the maximum antenna gain of the WWAN module so that FCC ERP limits for time based averaged power are met.
- Table d) shows the maximum antenna gain of the WWAN module so that FCC E(I)RP limits for burst power are met.

The lowest calculated antenna gain values (shown in bold letters) determine the highest allowed antenna gain of the WWAN module in stand-alone and collocated scenarios.

Antenna configuration for all scenarios:



Important note: this notebook configuration is an example. Different applications (e.g. M2M) are also possible as long as the same antenna-to-antenna and antenna-to-user distances are respected.

4.4.1 Scenario 0 : WWAN stand-alone

This scenario covers the following combination of collocated radio modules:

Transmitter	**primary**
communication system	**WWAN (GSM/UMTS)**
type	**KRD 131 18/2**
model	**F5521gw**
FCC-ID	VV7-MBMF5521GW1
IC-ID	287AG- MBMF5521GW1
max. EIRP (mW)	**see chapter 4.4**
max.antenna gain	**5.94 dBi / 2.50 dBi**

This scenario covers the following conditions:

- the antenna-to-user distance of all transmitters listed above is 20 cm or larger
- the maximum antenna gain of the WWAN transmitters does not exceed the values listed above

Note: other antennas for different communication systems may be installed in the host platform as long as they are not collocated to the WWAN antenna (distance > 20 cm)

4.4.2 Scenario 1 : WWAN + BT

This scenario covers the following combination of collocated radio modules:

Transmitter	**primary**	secondary
communication system	**WWAN (GSM/UMTS)**	BT
type	**KRD 131 18/2**	any
model	**F5521gw**	any
FCC-ID	VV7-MBMF5521GW1	any
IC-ID	287AG- MBMF5521GW1	any
max. EIRP (mW)	**see chapter 4.4**	76.43
max.antenna gain	**3.55 dBi / 2.50 dBi**	nn

This scenario covers the following conditions:

- the antenna-to-user distance of all transmitters listed above is 20 cm or larger
- the maximum antenna gain of the WWAN transmitters does not exceed the values listed above
- the averaged EIRP of the BT module does not exceed the value listed above
- the distance between WWAN and BT antennas is 0 cm or larger

Note: other antennas for different communication systems may be installed in the host platform as long as they are not collocated to the WWAN antenna (distance > 20 cm)

4.4.3 Scenario 2 : WWAN + WLAN

This scenario covers the following combination of collocated radio modules:

Transmitter	**primary**	secondary
communication system	**WWAN (GSM/UMTS)**	WLAN
type	**KRD 131 18/2**	any
model	**F5521gw**	any
FCC-ID	VV7-MBMF5521GW1	any
IC-ID	287AG- MBMF5521GW1	any
max. EIRP (mW)	**see chapter 4.4**	1995.26
max.antenna gain	**3.55 dBi / 2.50 dBi**	nn

This scenario covers the following conditions:

- the antenna-to-user distance of all transmitters listed above is 20 cm or larger
- the maximum antenna gain of the WWAN transmitters does not exceed the values listed above
- the averaged EIRP of the WLAN module does not exceed the value listed above
- the distance between WWAN and WLAN antennas is 0 cm or larger

Note: other antennas for different communication systems may be installed in the host platform as long as they are not collocated to the WWAN antenna (distance > 20 cm).

4.4.4 Scenario 3 : WWAN + WLAN + BT

This scenario covers the following combination of collocated radio modules:

Transmitter	**primary**	secondary	
communication system	**WWAN (GSM/UMTS)**	BT	WLAN
type	**KRD 131 18/2**	any	any
model	**F5521gw**	any	any

max. EIRP (mW)	**see chapter 4.4**	76.43	1995.26
max.antenna gain	**3.55 dBi / 2.50 dBi**	nn	nn

This scenario covers the following conditions:

- the antenna-to-user distance of all transmitters listed above is 20 cm or larger
- the maximum antenna gain of the WWAN transmitters does not exceed the values listed above
- the averaged EIRP of the WLAN module does not exceed the value listed above
- the averaged EIRP of the BT module does not exceed the value listed above
- the distance between WWAN, WLAN and BT antennas is 0 cm or larger

Note: other antennas for different communication systems may be installed in the host platform as long as they are not collocated to the WWAN antenna (distance > 20 cm)

4.4.5 Scenario 4 : WWAN + WiMAX

This scenario covers the following combination of collocated radio modules:

Transmitter	**primary**	secondary
communication system	**WWAN (GSM/UMTS)**	WiMAX
type	**KRD 131 18/2**	any
model	**F5521gw**	any
FCC-ID	VV7-MBMF5521GW1	any
IC-ID	287AG- MBMF5521GW1	any
max. EIRP (mW)	**see chapter 4.4**	1995.26
max.antenna gain	**3.55 dBi / 2.50 dBi**	nn

This scenario covers the following conditions:

- the antenna-to-user distance of all transmitters listed above is 20 cm or larger
- the maximum antenna gain of the WWAN transmitters does not exceed the values listed above
- the averaged EIRP of the WiMAX module does not exceed the value listed above
- the distance between WWAN and WiMAX antennas is 0 cm or larger

Note: other antennas for different communication systems may be installed in the host platform as long as they are not collocated to the WWAN antenna (distance > 20 cm)

4.4.6 Scenario 5 : WWAN + WiMAX + BT

This scenario covers the following combination of collocated radio modules:

Transmitter	**primary**	secondary	
communication system	**WWAN (GSM/UMTS)**	BT	WiMAX
type	**KRD 131 18/2**	any	any
model	**F5521gw**	any	any
FCC-ID	VV7-MBMF5521GW1	any	any
IC-ID	287AG- MBMF5521GW1	any	any
max. EIRP (mW)	**see chapter 4.4**	76.43	1995.26
max.antenna gain	**3.55 dBi / 2.50 dBi**	nn	nn

This scenario covers the following conditions:

- the antenna-to-user distance of all transmitters listed above is 20 cm or larger
- the maximum antenna gain of the WWAN transmitters does not exceed the values listed above
- the averaged EIRP of the WiMAX module does not exceed the value listed above
- the averaged EIRP of the BT module does not exceed the value listed above
- the distance between WWAN, WiMAX and BT antennas is 0 cm or larger

Note: other antennas for different communication systems may be installed in the host platform as long as they are not collocated to the WWAN antenna (distance > 20 cm)

4.4.7 Scenario 6 : WWAN + WiMAX + WLAN

This scenario covers the following combination of collocated radio modules:

Transmitter	**primary**	secondary	
communication system	**WWAN (GSM/UMTS)**	WLAN	WiMAX
type	**KRD 131 18/2**	any	any
model	**F5521gw**	any	any
FCC-ID	VV7-MBMF5521GW1	any	any
IC-ID	287AG- MBMF5521GW1	any	any
max. EIRP (mW)	**see chapter 4.4**	sum: 1995.26	
max.antenna gain	**3.55 dBi / 2.50 dBi**	nn	nn

This scenario covers the following conditions:

- the antenna-to-user distance of all transmitters listed above is 20 cm or larger
- the maximum antenna gain of the WWAN transmitters does not exceed the values listed above
- the averaged EIRP of the WiMAX module does not exceed the value listed above
- the averaged EIRP of the WLAN module does not exceed the value listed above
- the distance between WWAN, WiMAX and WLAN antennas is 0 cm or larger

Note: other antennas for different communication systems may be installed in the host platform as long as they are not collocated to the WWAN antenna (distance > 20 cm)

4.4.8 Scenario 7 : WWAN + WiMAX + WLAN + BT

This scenario covers the following combination of collocated radio modules:

Transmitter	**primary**	secondary		
communication system	**WWAN (GSM/UMTS)**	BT	WLAN	WiMAX
type	**KRD 131 18/2**	any	any	any
model	**F5521gw**	any	any	any

max. EIRP (mW)	**see chapter 4.4**	76.43	sum: 1995.26	
max.antenna gain	**3.55 dBi / 2.50 dBi**	nn	nn	nn

This scenario covers the following conditions:

- the antenna-to-user distance of all transmitters listed above is 20 cm or larger
- the maximum antenna gain of the WWAN transmitters does not exceed the values listed above
- the averaged EIRP of the WiMAX module does not exceed the value listed above
- the averaged EIRP of the WLAN module does not exceed the value listed above
- the averaged EIRP of the BT module does not exceed the value listed above
- the distance between WWAN, WiMAX, WLAN and BT antennas is 0 cm or larger

Note : other antennas for different communication systems may be installed in the host platform as long as they are not collocated to the WWAN antenna (distance > 20 cm)

Annex A: RF Exposure assessment

Annex A.1: Individual transmitters

The table on the following page lists all calculated power density values in relation to the limits defined in different standards, calculated for a distance of 20 cm from the antenna(s).

Fundamental data for calculating worst case EIRP of the primary and secondary transmitters are listed in chapter 4.3.

Equivalent power density at a distance of 20 cm is calculated by using the following formula:

$S_{eq} = P \cdot G / 4\pi \cdot r^2$ with P*G = EIRP and r = 20 cm

Then the ratio $S_{eq} / S_{\lim}$ is calculated for all applied limits.

During calculation the maximum EIRP of the primary transmitter is optimized so that the ratio S_{eq} / S_{lim} does not exceed a value of 1 for all applied limits for a comprehensive coverage of all relevant standards.

The calculation of S_{eq} / S_{lim} with reference to a certain standard is limited to those frequency bands that are generally used in regions where this standard is applied.

standard	EN	FCC/IC	AUS/NZ
region	Europe	USA,Canada	Australia New Zealand
GSM 850		x	
UMTS FDD V		x	x
(E)GSM 900	x		x
UMTS FDD VIII	x		
DCS 1800	x		x
UMTS FDD IV		x	
PCS 1900		x	
UMTS FDD II		x	
UMTS FDD I	x		x
ISM (WLAN/BT)	x	x	x
WiMAX	x	x	x

Note:
For frequencies above 2 GHz the limit is constant for all standards.
Therefore no frequency dependent differentiation is needed for radio technologies in this frequency band.

Annex A.2: Collocated transmitters

When transmitters with collocated antennas are active simultaneously a worst case assessment is necessary which takes additive effects into account.

In this case it must be insured that the sum of all worst case power densities of all active transmitters (according to the different scenarios) do not exceed the limits even if they are far below the limits for the single transmitter.

$$\sum_{1}^{n} \frac{S_{eqn}}{S_{\lim n}} = \frac{S_{eq1}}{S_{\lim 1}} + \frac{S_{eq2}}{S_{\lim 2}} + \ldots + \frac{S_{eqn}}{S_{\lim n}} \leq 1$$

The following tables show the results separated for different limits according to the standards listed in chapter 4.2.
The sum that comes closest to 1 represents the worst case and limits the antenna gain that is allowed for the WWAN module.
